

Driving Documentum value with best in class software and services for capture, management, and access to corporate information.

Documentum Software and Configuration Services

Documentum is the heart of your information organization. Trinity Technologies increases the strength and reach of your mission-critical content with our *Quick Start* products and services that integrate Documentum with financial systems, geographic information systems, maintenance management systems, e-mail, computer aided design, and legacy data.

Trinity Technologies' software and services enhance and extend the way documents are captured, managed, and retrieved in Documentum. Your company content transforms into a living Information Asset® system that brings with it the power to make better and faster decisions. Work with us to map work processes into Documentum that bring clarity, precision, and continuity to everyday activities; thus achieving bottom line benefits to your enterprise.

Trinity Technologies' applications and services build on Documentum's features, including:

- Perform full-text searches on any document type with a browser using Trinity Technologies' ISE software.
- Load AutoCAD® or MicroStation® drawings and capture attributes in Documentum automatically with Trinity Technologies' CADCapture software.
- Export drawings and documents stored in Documentum into a universal Windows format with Trinity Technologies' DocExport.
- Integrate Documentum with financial systems to automate transactional work processes and search relevant data related to financial transactions.
- Provide a single point of interface for the people who work on maintenance systems by integrating MAXIMO

or PassPort with Documentum.

- Connecting geographic information systems with Documentum provides the bridge to connect spatial locations with the associated content and records.
- Ensure that documents are secure while they are checked out. Security for Documentum will retain Documentum's permission sets outside of your repository.
- Leverage 3D models integration with Documentum with Trinity Technologies' Plant Design Model Integration Service.
- Collect, retain, archive, and leverage design basis information for lifecycle information management with Trinity Technologies' Design Basis Service.
- Go to the next level in content management by upgrading to Documentum's latest releases and technologies.

Trinity Technologies specializes in advancing Documentum for power and utilities, energy, chemical, financial, legal, and pharmaceutical companies.

Quick Start Software

ISE

Intelligent Search Engine searches every document type with only a browser

Trinity Technologies ISE software—pronounced “eyes”—for Documentum allows users to perform full text searches on virtually any file format, includ-

ing drawings. ISE, the Intelligent Search Engine, greatly extends the capabilities of Documentum search functions by working with the Documentum Webtop Client to deliver both power and simplicity of use.

Using term-hit-highlighting, ISE displays all documents containing search terms without opening every file. ISE displays a snippet of the found search words in a preview pane, or the highlighted search terms can be displayed singularly. This feature dramatically reduces the time for searches of any document. It is particularly useful for large documents such as operating procedures, maintenance instructions, licensing documentation, reports, and drawings.

CADCapture

Capture AutoCAD and MicroStation drawings and electronically read and load attributes into Documentum

CADCapture enables companies to take advantage of the intelligence contained in each drawing by automatically extracting tag, text and title block information and mapping them to Documentum attributes electronically. This enables users to quickly search for drawings in the content repository based on the tag information contained in the drawing itself and using methods with which plant and engineering personnel are familiar.

When a CAD drawing needs to be updated, CADCapture allows check out and changes. The drawing goes through a change audit process before being checked back into Documentum. CADCapture extracts the drawing attributes, populates the database, and prepares a comparison report to show deltas. Not only does CADCapture let users search and find drawings in sec-

onds; it also provides a mechanism for quality assurance and retaining historical information about the drawing.

DocExport

The easy way to turn over project data in a format the owner can readily use

DocExport makes it possible to quickly, easily, and securely export Documentum content and attribute information to portable media or file/server locations. The key advantage of DocExport is that anyone using Windows can view and access the project data—whether he or she uses Documentum or not.

DocExport is particularly valuable for engineering firms performing project work for owner/operators. The software helps the firm turn over project data to the owner in a format the owner can readily use. It automatically exports the project data to CD or other media for archiving, it also handles bulk export of content and attributes while retaining the original file structures.

GeoISE

Geographic Intelligent Search Engine connecting text/keyword search with geographic search

GeoISE is a remarkable solution for the mobile workforce that connects text/keyword search within Documentum

“Trinity Technologies has a proven track record of success in Documentum implementations,” says Ron Pach, Global Strategic Alliance Manager at Documentum. “Our joint customers will benefit from Trinity Technologies’ expertise in technology, work processes, and cultural change.”

The Three Facets of Trinity Technologies

Technology

Our in-depth knowledge and proven experience with Documentum and other applications puts you ahead of the competition.

Work Processes

We map your ways of working with Documentum, resulting in a powerful system that directly reflects your company processes.

People

Our people are experts at communicating change and training.

We help your people adapt and become productive quickly.

with powerful spatial searching. GeoISE offers the solution to rapidly access information in the Documentum repository and then maps, categorizes and searches using geographic parameters and overlay on a map/network. By allowing all relevant information at a particular address or location to be rapidly retrieved and displayed on a map, users can view geographic trends and relationships in business workflows over a period of time, spending less time searching for information and more time making business critical decisions.

Services for Documentum

Trinity Technologies is the Documentum Integrator of Choice

Reduce risks by making valuable company content available for day-to-day decisions

Trinity Technologies' strength is integrating Documentum with a range of information systems focused on financial analysis, maintenance management, geographic information systems, and engineering content.

Financial Systems

Trinity Technologies integrates Documentum with financial solutions such as PeopleSoft/Oracle JD Edwards®, SAP®, and Great Plains®. Through the DocuSphere for Documentum application, we can automate transactional workflow processes, and capture and search relevant data electronically related to financial transactions, such as accounts payable.

Maintenance Management Systems

Documentum integration with MRO MAXIMO® and Indus PassPort® systems provides a single point of interface for the many people who work on maintenance activities. Web and content management technology from Documentum make it easy to ask business-critical questions and arrive at mission-critical answers.

WHAT IS AN INFORMATION ASSET?

An Information Asset is any information that has business value and is created, managed, or accessed during the operation of the business.

Geographic Information Systems

Trinity Technologies has integrated Documentum with Smallworld®, by General Electric Network Solutions, an application that helps utility companies leverage spatial data throughout their enterprise. Documentum provides the content repository for linking GIS locations with the associated content and records. By working in a single environment, staff can focus on customer service instead of navigating the computer system.

Engineering Systems

Trinity Technologies integrates Documentum with CAD programs such as AutoCAD, MicroStation, and Intergraph PDS to create a complete view of all facility data. This creates a platform for data to be reused in maintenance and future construction projects.

Trinity Technologies Plant Design Model Integration Service

A powerful way to leverage design information

Use a 3D electronic model or 2D schematics as a visual interface for retrieving equipment files, operating procedures, and equipment specifications in Documentum. Trinity Technologies leverages and extends the use of valuable schematics and 3D models by making them work with a variety of design and operations systems.

Design Basis Service

Collect, retain, archive, and leverage design basis information for the lifecycle

Essential for regulated industries, Trinity Technologies Design Basis Service collects, retains, and archives in Documentum the design basis information about a plant facility. The Documentum-based workflow is a system for registering documents against equipment tag numbers and documentation requirements. The result is a

complete record of equipment design, and revision, review, and approval cycles—and improved cycle time and predictability.

Documentum Upgrades

Move to the next level in document management

Quickly make use of advances in the new Documentum systems through migration services from Trinity Technologies.

Client Successes

A **global engineering company** chose Trinity Technologies to establish their document management strategy for **document retention related to project and corporate activities**. Nine years later that company is still a client of Trinity Technologies' and has implemented the Documentum system on virtually every major power project. Trinity Technologies has served as their constant partner on technology migrations, project configurations, and integration activities.

An **international financial services company** selected Trinity Technologies to develop and implement their **contracts management system** for product sales documents. The work processes include electronic loading from the

order management system, distribution to account managers, automated price specification, legal review, and transmittal to clients.

A **diversified energy company** engaged Trinity Technologies to improve the management of their corporate functions. Trinity led the design, configuration, and implementation of their **legal department management system**. From there, Trinity Technologies brought together their JD Edwards World and One World systems with Documentum through the DocuSphere for Documentum product. Delivering the **transactional workflows for the accounts payable functions, as well as the image repository within Documentum**, the company now has an integrated and seamless system for supporting all of their daily processes.

A **major Midwest utility** retained Trinity Technologies to configure and integrate their **operating plant information** across the nuclear generation fleet. The work included integration with the maintenance management/work order system, configuration of workflows for regulatory compliance activities, and capture of all major operating procedures and technical documents.

We make technology work.

About Trinity Technologies

Trinity Technologies is a solutions provider to a broad range of industries including process, power, energy, chemical, financial, legal, and pharmaceutical. Trinity Technologies' products and service solutions help to better manage a company's Information Assets®. Trinity Technologies offers expertise in content management, technology implementation and integration, work process development, and benchmarking. Trinity Technologies is headquartered in Massachusetts.
